

Geologic Map Lab Learning Objectives

The student should understand and know:

- 1) The terminology and basic symbols of geology maps
- 2) How to read and understand a geology map legend
- 3) The general concepts and field methods used in making a geology map
- 4) How to successfully recognize structures on a geology map such as contacts, bedding orientation, folds and faults
- 5) How to reconstruct the geologic history of the mapped region based on the geologic map information.

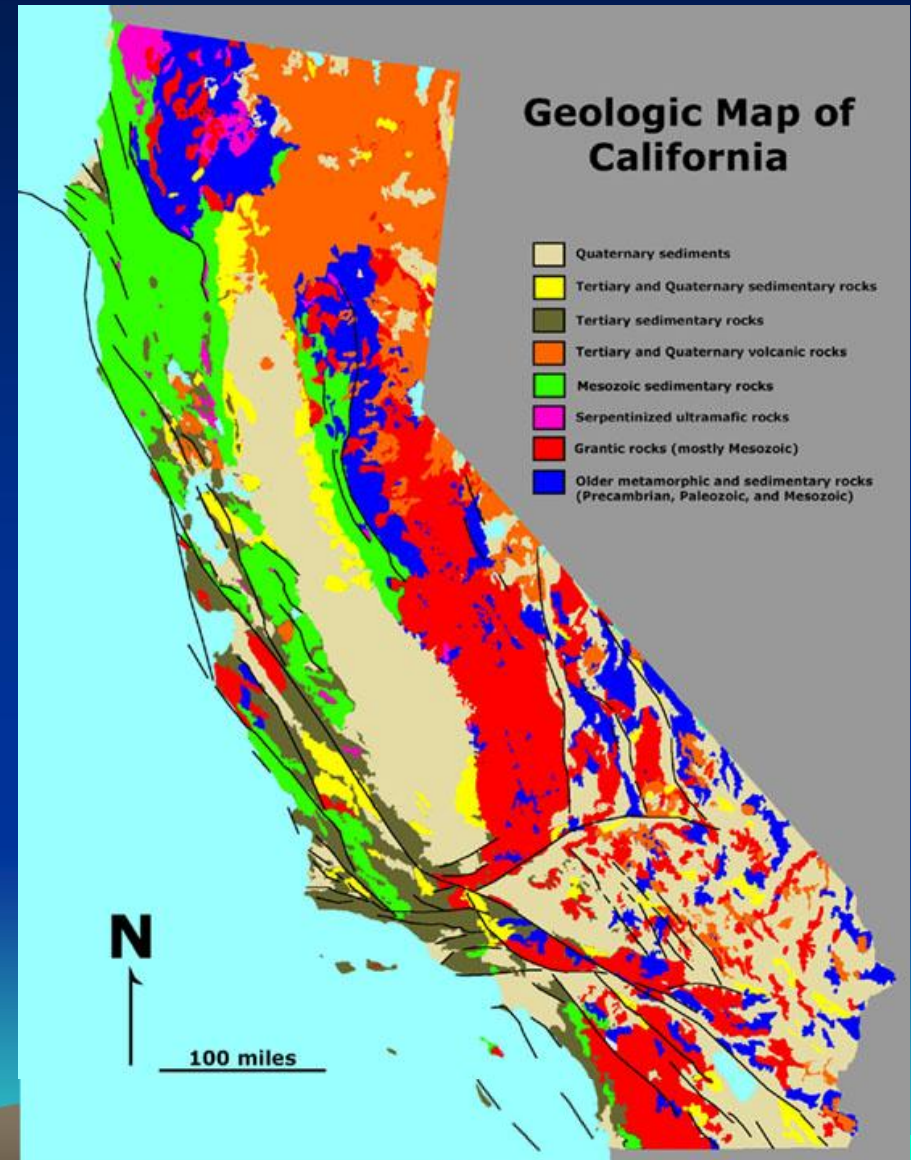

Usefulness of Geology Maps

1) Geology maps have many vital uses:

- ✓ Mineral Prospecting
- ✓ Engineering
- ✓ Earthquakes
- ✓ Historical geology
- ✓ Landform studies
- ✓ Soil development
- ✓ Biological studies

2) Geology maps are even useful when buying a home. Why?

Geology Map Key or Legend

1) The map key lists and explains the geologic rock formations and the structural symbols

- ✓ Rock Names
- ✓ Rock Types
- ✓ Rock Ages
- ✓ Contacts
- ✓ Strike and Dip
- ✓ Faults and Folds

MAP KEY	
 af - Artificial Fill (Historic)	 Contact
 alf - Artificial Levee Fill (Historic)	 Contact, approximately located
 Qhaf - Alluvial Fan Deposits (Holocene)	 Contact, inferred
 Qhfp - Floodplain Deposits (Holocene)	 Contact, concealed
 Qhb - Flood Basin Deposits (Holocene)	 Fault
 Qhba - Salt Affected Flood Basin Deposits (Holocene)	 Fault, approximately located
 Qhl - Natural Levee Deposits (Holocene)	 Fault, inferred
 Qpaf - Alluvial Fan Deposits (Pleistocene)	 Fault, uncertain
 Qpof - Older Alluvial Fan Deposits (Pleistocene)	 Fault, concealed
 Tv - Unnamed volcanic rocks (Miocene)	 Fault, concealed and uncertain
 Tor - Ocala conglomerate (Miocene)	 Oblique fault with thrust or reverse component
 Tbr - Briones sandstone (Miocene)	 Oblique fault with thrust or reverse component, approximately located
 Tt - Tice shale (Miocene)	 Oblique fault with thrust or reverse component, inferred
 Tcs - Claremont shale (Miocene)	 Oblique fault with thrust or reverse component, uncertain
 Ts - Soberanes sandstone (Miocene)	 Strike and dip of bedding
 Tsh - Unnamed shale and sandstone (Miocene)	 Strike and dip of overturned bedding
	 Strike and dip of vertical bedding

2) Each rock unit has a unique letter symbol and is color-coded

3) Map key is vital to understanding the accompanying geology map

The Basic Rules of Structure

- 1) Strike of beds is always parallel to the direction of the contacts.
 - 2) Rock layers dip towards the youngest exposed rock layers.
 - 3) Oldest rocks exposed in the center of eroded anticlines and domes.
 - 4) Youngest rocks exposed in the center of eroded synclines and basins.
 - 5) Horizontal folds form parallel sets of belt-like outcrop patterns.
 - 6) Plunging synclines form "V" or "U" shaped, belt-like outcrop patterns.
 - ✓ Fold plunges toward *open* end of "U" pattern.
 - 7) Plunging anticlines form "V" or "U" shaped, belt-like outcrop patterns.
 - ✓ Fold plunges toward *closed* end of "V" or "U" pattern.
 - 8) Steeper the dip of the layer, the more narrow the width of its outcrop.
 - 9) Hanging wall *moves up* relative to foot wall in reverse and thrust faults.
 - 10) Hanging wall *moves down* relative to foot wall in normal faults.
-
